Project Title: Organic Agri-diversity in 1.1 cents of land

Team Members: Jisna J., Prince A., Anitta R., Eldho S., Aloysius T., Joyal J., Bindu M.

Abstract: Agriculture is the backbone of the Indian society. Approximately, 60% of the Indian population works in the agricultural sector and it contributes to about 18% of the country's GDP. Yet, the farming practices in the country are declining. The younger generations are chasing after the white collar jobs, seeking better standard of living, modernization, and to be a part of the global interconnected world. This is why we bring forth this proposal, which we hope to inspire the present and the future generations to actively indulge in farming and agricultural practices.

We have been observant and came up with an organic farming plan that we believe can be practiced by everyone, with little space, making use of our own farm produces. Our effort is to reduce the overdependence on chemical fertilizers and pesticides, efficiently utilizing the already scarce agricultural spaces. From finding the suitable fertile land, to planting seeds, procuring the farm needs, to irrigation techniques we have tried to come up with an inclusive model. Apart from the traditional methods, we propose raised beds, hydroponics farming, terrace farming, aquaponics farming, aeroponics farming, etc. We are addressing the issues of food security, procuring non- toxic vegetables and fruits, organic farming, natural feeds and organic pesticides.

Some of our aims are health through soil, leading and inspiring an organic livelihood, implementing organic pesticides, using a variety of fruits, vegetables and flowers. We are trying to find more and attractive income sources, to bring man closer to soil and with the locally acquired knowledge we want to spread the message to the world that our life revolves around nature. And for a sustainable future, our land and agriculture is for us to practice, protect and preserve.
