Project Title: Vertical Farming

Team Members: Ashwini D., Anand K.

Abstract: Agriculture is facing ever increasing input cost for farming, scarcity of cultivable land, migration of farming community and urbanization So our new concept is about tackling this problem by VERTICAL FARMING/MULTI LAYER FARMING. Just like in cities multi level apartments solve space issues, similarly vertical farming also provides an alternative to traditional farming. Vertical farming involves modern scientific techniques.

It requires stacking of multiple levels upon one another, where the plant/vegetable growth is executed on these stacks/ layers in controlled environment. The growth medium used is a mixture of soil and nutrients prepared scientifically. Entire process is conducted in a controlled environment. The layers provides the best way to save space and achieve high production in limited resources.
